

CARPET MAINTENANCE

It's incredible how a new carpet changes the style and elegance of a room. Today's carpets come in designer styles and high-tech innovations that push away the soil and stains from carpet fibre. Not only will your carpet stay cleaner, it will stay beautiful longer.

In the months following installation, you may notice some common characteristics. These are all normal and will not affect the carpet's life or beauty in any way:

- **Shedding (loose fibers):** This is normal and subsides within a short time with vacuuming.
- **Sprouting:** A single tuft extending beyond the carpet surface, usually along walls or at seams. Simply cut it off - *do not pull*.
- **Pile Reversal and Shading:** Describes what seems to be a colour change in various parts of the carpet. The same area may appear light when viewed from one direction and dark from another. This is caused by light being reflected in different ways as pile is bent in various directions. This is not a product defect, but rather a characteristic of plush carpet.
- **Buckling and Wrinkling:** May sometimes occur in wall-to-wall carpet installations. If the ripples persist, call Nufloors, as it may be necessary to professionally restretch the carpet.

Vacuuming - Everyday Care:

A regular maintenance program extends the life and the appearance of your carpet:

- Vacuum often the areas which receive the most traffic.
- Vacuum the entire carpeted area a minimum of twice per week.
- Use walk-off mats at all entrances.
- When vacuuming move your furniture an inch or more from its original position to prevent excessive crushing of the carpet pile.
- Protect your carpet from sunlight by using blinds, shades or other window treatments.
- Use furniture coasters under heavy furniture legs.

If you're finding that no matter how much you vacuum, your carpet still does not look like it used to, it may be time for a deep cleaning. While there are do-it-yourself cleaning methods on the market, hiring a professional may be the safest, fastest and easiest option. Consider the services of a carpet cleaning professional before your carpet and rugs begin to show soil. Allowing carpet and rugs to become excessively soiled will make cleaning more difficult and will shorten its useful life. Recommendations can be obtained from satisfied friends, Nufloors, the Better Business Bureau, and local business groups for reliable, certified cleaning professionals in your area. Choose a carpet cleaning professional who is properly trained.

A professional steam cleaning/hot water extraction at least once every 18 months from the date of purchase may be required to maintain your warranty. We recommend you check the details of your warranty.

Soiling around the Edges

Filtration soil is a term used to describe dark, grayish lines that may appear on carpet. This is not a carpet defect, but a situation in which dust and other airborne pollutants can accumulate on the carpet face fibers in areas with a concentrated flow of air over the carpet or through tiny cracks or other open areas under the carpet. The soiling condition can occur quickly, or it may develop over a period of months or years. Filtration soiling is not a result of the quality of carpet selected. The condition will obviously appear more pronounced on lighter colourations than darker colourations.

Filtration soil may appear around baseboards, under doors, along the edges of stairs and possibly away from walls where plywood subflooring materials have been joined. Preventing airflow through carpet and carpet edges by sealing cracks in the subfloor, as well as under baseboards and edges of stairs, may reduce filtration soiling problems.

Spot Solver

Most carpet available today has been treated with a stain-resist treatment, so many spills can be removed if immediate action is taken. The longer the delay, the higher the probability of a spill becoming a permanent stain. Staining is influenced by many factors, and no carpet is completely stain proof.

Spot Removal Steps - ACT QUICKLY!

- Blot liquids with a dry, white, absorbent cloth or white (no printing) paper towels.
- **Do not scrub the area!** Scrubbing can cause pile distortion in the affected area. Continue to use a dry cloth or paper towels until the area is completely dry. For semi-solids, gently scrape up with a rounded spoon. Solids should be broken up and vacuumed until completely removed.
- Pretest any spot removal agent in an inconspicuous area to make certain the solution will not damage the fiber or the dye. After applying several drops to the testing area, hold a white cloth on the wet area for 10 seconds. Examine the carpet and cloth for colour transfer, colour change, or damage to the carpet. If a change occurs, another cleaning solution should be selected. **Courtesy of the Carpet and Rug Institute*
- Apply a small amount of the selected cleaning solution to a white cloth, allow to sit for about 10 minutes and work in gently.
- Work from the edges of the spill to the center to prevent the spill from spreading. Do not scrub. Blot, absorbing as much as possible and repeat if necessary.
- Continue using the first cleaning solution as long as there is a transfer of the spill to the cloth. It is not necessary to use all of the cleaning solutions if the first solution removes the spill. Be patient. **Complete removal of the spill may require repeating the same step several times.**
- After the spill has been completely removed, rinse the affected area thoroughly with cold water and blot with a dry cloth until all of the solution has been removed. Some cleaning solutions will cause rapid soiling if the solution is not completely removed. Apply a one-half inch layer of white paper towels to the affected area and weigh down with a flat, heavy object. Continue to change paper towels as needed.

Many fiber manufacturers provide a toll-free cleaning assistance and advice (consult your warranty). Note the use of any topical treatment other than those recommended by the carpet manufacturer may void your stain warranty.

Difficult Stains

Bleaching Solutions

Many household cleaning products contain bleaching ingredients that can destroy carpet colour, leaving a white or yellow discolouration.

Blood

To remove blood, use only cool cleaning solutions to prevent setting the stain. Removal of bloodborne pathogens may require the assistance of a carpet cleaning professional.

Burns

Burn damage can be remedied only by reweaving, retufting, or resectioning the damaged area. However, the appearance of an area of charred carpet can be improved by carefully clipping off blackened ends of tufts using small, sharp scissors. Trim surrounding tufts to minimize indentation.

Candle Wax or Chewing Gum

Freeze with ice by placing the ice in a metal pan and setting pan on top of wax or gum. Allow to sit for about 10 minutes, until frozen. Break with a blunt instrument (i.e. a knife handle). Vacuum up the pieces. Repeat until removed. Using alcohol or a dry-cleaning solvent on a white absorbent cloth, blot the spot to dissolve the remaining residue and remove with fingers.

Dye Stains

Many beverages, medicines, cosmetics, foods, and other liquids contain dyes. These dyes may be absorbed into the fibers making removal very slow or impossible. Follow recommended procedures on the spot removal chart. If removal does not appear to be possible, call your carpet cleaning professional for advice. Sometimes the stain can be hidden by spot dyeing, retufting, or by repairing the affected area.

Inkjet Cartridge

Blot with dry absorbent white cloth, use a wet vac or extraction machine to remove as much of the residue as possible. Blot with rubbing alcohol (isopropyl) applied with a white cloth, if stain remains, blot with household hydrogen peroxide. (Slight bleaching may occur.) If no change in affected area, consult with a carpet care professional.

Fingernail Polish

Use a non-acetate fingernail polish remover. Apply a small amount of the fingernail polish remover to a white cloth and work in gently - do not rub - working from the edges of the spill to the center to prevent spreading. Allow to remain on the spill a few minutes. Be patient, blotting the area several times.

Lukewarm tap water should be used in most cases to rinse the cleaning solutions from the carpet fiber. Failure to completely rinse the solutions from the fiber may cause accelerated soiling.

Ink (Ballpoint Pen)

Follow recommended procedures on the spot removal chart to contain the spill using rubbing alcohol as the dry

cleaning solvent. Rubbing alcohol (90% isopropyl) can be used as a dry cleaning solvent by applying with a cloth or towel. Do not pour rubbing alcohol directly onto the carpet.

Mustard

Some mustards contain very strong dyes that are difficult to remove. It may be necessary to remove the stained area and reinsert an undamaged section of carpet.

Rust

Rust almost always requires professional service because the chemicals required are hazardous when used improperly. If the stain is fresh, the spot removal chart may be successful.

Descriptions of Spot Removal Solutions:

IMPORTANT WARNING

Carpet fibers may react differently when treated for stains. We recommend you contact the appropriate fiber company for their suggested maintenance recommendations before proceeding with any of the following cleaning guidelines. Failure to follow the fiber company's guidelines may result in your warranty being voided.

Dry Cleaning Fluid/Solvent - A non-flammable spot removal solution, or dry-cleaning type solvent, is preferred. Exercise caution when using a solvent and follow manufacturer instructions. Never pour it directly onto the carpet or allow it to reach the backing, because it can damage the latex that holds the primary and secondary backings together. Solvents are available in the cleaning supply section of hardware and home supply stores.

Nail Polish Remover

Two types of nail polish removers are available. One type contains acetone, a dry-cleaning solvent. Use the same precautions as with other dry-cleaning solutions. The second type contains amyl acetate, which is used in many paints, oil, grease (POG) removers. Many POG removers leave residues that may cause rapid soiling. When using a POG remover, always rinse the area thoroughly with a dry solvent.

Detergent Solution

Mix one fourth (1/4) teaspoon of a liquid dishwashing detergent per one (1) cup of lukewarm water. NEVER USE A STRONGER CONCENTRATION! Thorough rinsing is necessary to remove detergent residues that may cause rapid soiling. It may be necessary to rinse with warm water several times to completely remove residues. Care should be used in selecting a detergent. Never use a laundry detergent of any type, because laundry detergents may contain optical brighteners (fluorescent dyes) that dye the fiber. Do not select an automatic dishwashing detergent because many contain bleaching agents that destroy dyes and some fibers.

Warm Water

Lukewarm tap water should be used in most cases to rinse the cleaning solutions from the fiber. Failure to completely rinse the solutions from the fiber may cause accelerated soiling.

Vinegar Solution

Mix one (1) cup of white vinegar to two (2) cups of water. White vinegar is a 5% acetic acid solution. It is used most often to lower the alkalinity caused by detergent solutions or alkaline spills.

Ammonia Solution

Mix one (1) tablespoon of household ammonia per cup of water. Please note: Be aware that ammonia, if used improperly, can cause colour change. Be sure to test a hidden area.

Spot Removal Kit

Follow directions closely. Some spot removal kits contain: (A) a detergent solution and (B) a stain - resist solution. Use of the (B) solution prior to the complete removal of the spill may cause a permanent stain. Other spot removal kits may contain dry extraction cleaning compound that can be used effectively for most common household stains.

Call a Professional

Professional cleaners have the ability and the equipment to use more aggressive cleaning solutions to remove stubborn spills. Always consider consulting a professional cleaner regarding any spot removal question.

Find your spot in the list. Then, in numerical order, use the cleaning solutions listed (see descriptions of spot removal solutions). Continue using solution #1 as long as there is improvement in removing the spot. If no improvement, proceed to solution #2, solution #3, etc. until the spot is completely removed.

NUFLOORS provides the information contained herein to its customers as an information source only. The products identified in this brochure may have chemicals that cause reactions in certain individuals. Nufloors strongly recommends the use of safety glasses, respirators (masks) and gloves in handling any materials that contain chemicals. Nufloors recommends that you ALWAYS test a small area PRIOR to usage of any cleaning/maintenance product to determine whether the product you are about to apply serves its intended purpose.
